

## Applications

### *Frequency-domain EEG applications and methodological considerations*

- Emotion Asymmetries
  - Lesion findings
    - Catastrophic reaction (LH)
    - RH damage show a belle indifference
  - EEG studies
    - Trait (100+ studies)
    - State (oodles more studies)

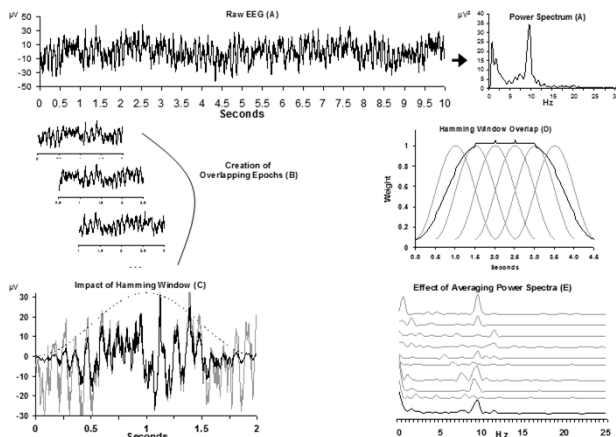

## Types of Studies

- Trait
  - Resting EEG asymmetry related to other traits (e.g. BAS)
  - Resting EEG asymmetry related to psychopathology (e.g. depression)
  - Resting EEG asymmetry predicts subsequent emotional responses (e.g. infant/mom separation)
- State
  - State EEG asymmetry covaries with current emotional state (e.g., self report, spontaneous emotional expressions)

## Trait, Occasion, and State variance

- Three sources of reliable variance for EEG Asymmetry
  - *Stable trait consistency* across multiple assessments
  - *Occasion-specific variance*
    - reliable variations in frontal asymmetry across multiple sessions of measurement
    - may reflect systematic but unmeasured sources such as current mood, recent life events and/or factors in the testing situation.
  - *State-specific variance*
    - changes within a single assessment that characterize
      - the difference between two experimental conditions
      - the difference between baseline resting levels and an experimental condition.
      - conceptualized as proximal effects in response to specific experimental manipulations
      - should be reversible and of relatively short duration
- Unreliability of Measurement (small)

Allen, Coan, & Nazarian 2004

## Alpha Vs Activity Assumption (AAA)

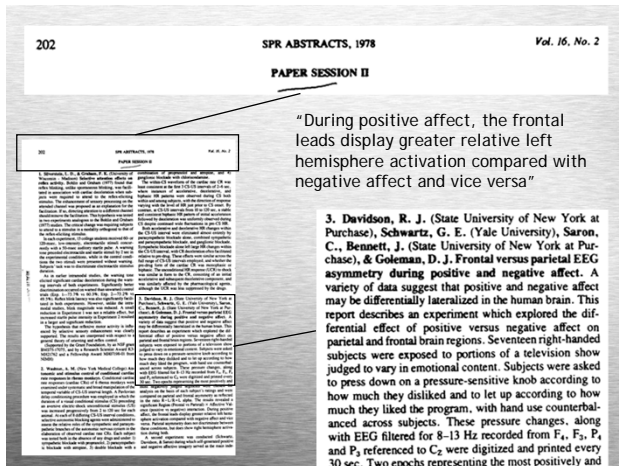

Oakes et al, 2004, *Human Brain Mapping*

## Alpha and Activity

- May be more apt to think of alpha as regulating network activity
- High alpha has inhibitory function on network activity (more in advanced topics)

## EEG Asymmetry, Emotion, and Psychopathology

## Left Hypofrontality in Depression

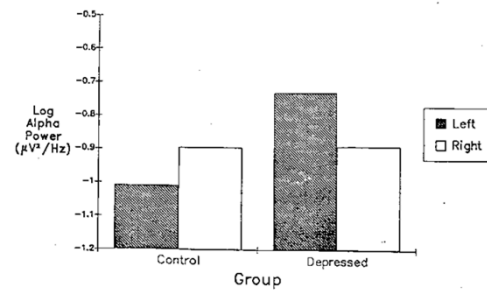

Figure 1. Mean log-transformed alpha (8-13 Hz) power (in  $\mu V^2/Hz$ ) for C<sub>2</sub>-referenced electroencephalograms (averaged across eyes-open and eyes-closed baselines), split by group and hemisphere, for the mid-frontal region. (Decreases in alpha power are indicative of increased activation)

Henriques & Davidson (1991); see also, Allen et al. (1993), Gotlib et al. (1998);  
Henriques & Davidson (1990); Reid Duke and Allen (1998); Shaffer et al (1983)

## Individual Subjects' Data

Henriques & Davidson (1991)

## Valence Vs Motivation

- Valence hypothesis
  - Left frontal is positive
  - Right frontal is negative
- Motivation hypothesis
  - Left frontal is Approach
  - Right frontal is Withdrawal
- Hypotheses are confounded
  - With possible exception of Anger

## State Anger and Frontal Asymmetry

Correlation with alpha asymmetry ( $\ln[\text{right}] - \ln[\text{left}]$ ) and trait anger. Positive correlations reflect greater left activity (less left alpha) is related to greater anger.

After Harmon-Jones and Allen (1998).

Harmon-Jones & Sigelman, *JPSP*, 2001

- Would situationally-induced anger relate to relative left frontal activity?

## Method

- Cover story: two perception tasks – person perception & taste perception
- Person perception task – participant writes essay on important social issue; another ostensible participant gives written feedback on essay
- Feedback is neutral or insulting
  - negative ratings + “I can’t believe an educated person would think like this. I hope this person learns something while at UW.”

Harmon-Jones & Sigelman, *JPSP*, 2001

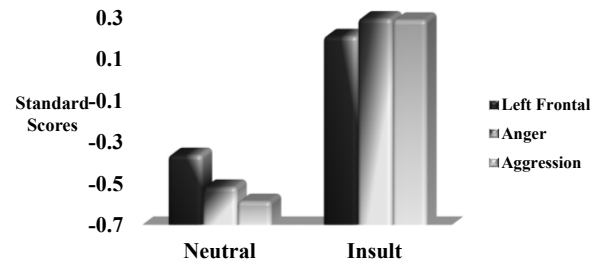

- Record EEG immediately after feedback
- Then, taste perception task, where participant selects beverage for other participant, “so that experimenter can remain blind to type of beverage.”
- 6 beverages; range from pleasant-tasting (sweetened water) to unpleasant-tasting (water with hot sauce)
  - Aggression measure

Harmon-Jones & Sigelman, *JPSP*, 2001

Harmon-Jones & Sigelman, *JPSP*, 2001

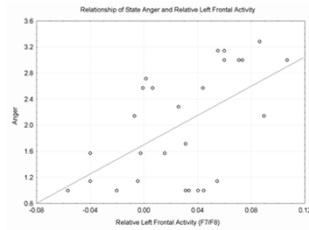

## Relative Left Frontal, Anger, & Aggression as a Function of Condition

Harmon-Jones & Sigelman, *JPSP*, 2001

## Frontal EEG asymmetry predicts Anger and Aggression

- Not in Neutral condition ... no relationship
- Strongly in Insult condition
  - $r = .57$  for anger
  - $r = .60$  for aggression
  - Note: partial  $r$  adjusting for baseline indiv diffs in asymmetry and affect

Harmon-Jones & Sigelman, JPSP, 2001

Figure 1. Relation between noise length and frontal-central asymmetry during right-hand contractions. Higher asymmetry scores indicate greater relative left than right activation.

Peterson, Shackman, Harmon-Jones (2008)

## Manipulation of EEG

Peterson, Shackman, Harmon-Jones (2008)

- Hand contractions to activate contralateral premotor cortex
- Insult about essay (similar to Harmon-Jones & Sigelman, JPSP, 2001) followed by chance to give aversive noise blasts to the person who insulted them
- Hand contractions:
  - altered frontal asymmetry as predicted
  - Altered subsequent aggression (noise blasts)
- Asymmetry during hand contractions predicted aggression

## The BAS/BFS/Approach System

- sensitive to signals of
  - conditioned reward
  - nonpunishment
  - escape from punishment
- Results in:
  - driven pursuit of appetitive stimuli
  - appetitive or incentive motivation
  - Decreased propensity for depression (Depue & Iacono, 1989; Fowles 1988)

## Motivational Styles and Depression

### Behavioral Activation Scale

- Reward Responsiveness
  - When I see an opportunity for something I like, I get excited right away.*
- Drive
  - I go out of my way to get things I want.*
- Fun Seeking
  - I'm always willing to try something new if think it will be fun.*

Carver & White, 1994

## Motivational Styles and Depression

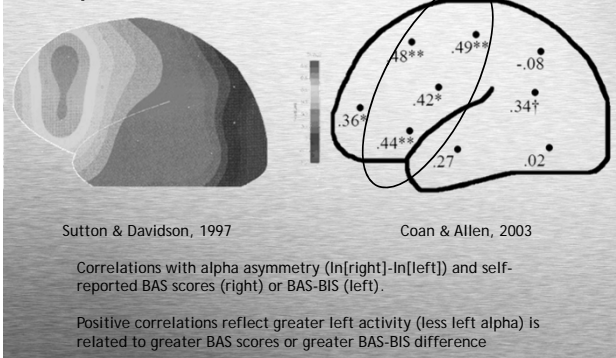

$$r = .45$$

Mid-Frontal Asymmetry and BAS Scores  
Mid-Frontal Asymmetry and PA Scores

$$r = .00$$

Harmon-Jones & Allen, 1997

## Motivational Styles and Depression Replications

### L>R Activity (R>L Alpha) characterizes:

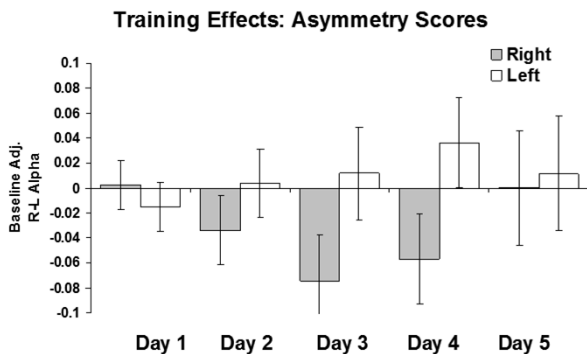

- an approach-related motivational style (e.g. Harmon-Jones & Allen, 1997; Sutton & Davidson, 1997)
- higher positive affect (e.g. Tomarken, Davidson, Wheeler, & Doss, 1992)
- higher trait anger (e.g. Harmon-Jones & Allen, 1998)
- lower shyness and greater sociability (e.g. Schmidt & Fox, 1994; Schmidt, Fox, Schulkin, & Gold, 1999)

### R>L Activity (L>R Alpha) characterizes:

- depressive disorders and risk for depression (e.g. Allen, Iacono, Depue, & Arbisi, 1993; Gotlib, Ranganath, & Rosenfeld, 1998; Henriques & Davidson, 1990; Henriques & Davidson, 1991 but see also Reid, Duke, & Allen, 1998)
- certain anxiety disorders (e.g. Davidson, Marshall, Tomarken, & Henriques, 2000; Wiedemann et al., 1999)

## Correlations ≠ Causality

- Study to manipulate EEG Asymmetry
- Five consecutive days of biofeedback training (R vs L)
  - Nine subjects trained “Left”; Nine “Right”
  - Criterion titrated to keep reinforcement equal
- Tones presented when asymmetry exceeds a threshold, adjusted for recent performance
- Films before first training and after last training

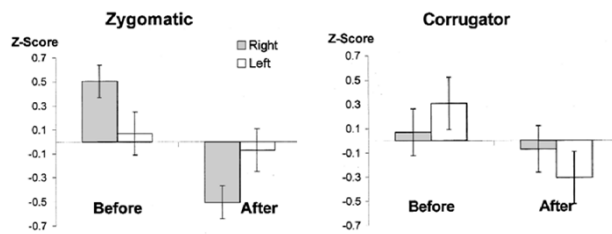

Manipulation of EEG asymmetry with biofeedback produced differential change across 5 days of training; Regression on Day 5

From Allen, Harmon-Jones, and Cavender (2001)

Despite no differences prior to training, following manipulation of EEG asymmetry with biofeedback subjects trained to increase left frontal activity report greater positive affect.

From Allen, Harmon-Jones, and Cavender (2001)

From Allen, Harmon-Jones, and Cavender (2001)

## Manipulation of Asymmetry using Biofeedback

- Phase 1: Demonstrate that manipulation of EEG asymmetry is possible
- Phase 2: Determine whether EEG manipulation has emotion-relevant consequences
- Phase 3: Examine whether EEG manipulation produces clinically meaningful effects
- Phase 4: Conduct efficacy trial

### Phase 3a

Biofeedback provided 3 times per week for 12 weeks

### Phase 3b

“Open Label” pilot trial, with biofeedback provided 3 times per week for 12 weeks

## Phase 4: Randomized Control Trial

- Depressed subjects ages 18-60 to be recruited through newspaper ads
- Ad offers treatment for depression but does not mention biofeedback
- Participants meet DSM-IV criteria for Major Depressive Episode (nonchronic)

## Design

- Contingent-noncontingent yoked partial crossover design
- Participants randomly assigned to:
  - *Contingent Biofeedback*: tones presented in response to subject’s EEG alpha asymmetry
  - *Noncontingent Yoked*: tones presented that another subject had heard, but tones not contingent upon subject’s EEG alpha asymmetry
- Treatments 3 times per week for 6 weeks
- After 6 weeks, all subjects receive contingent biofeedback 3 times per week for another 6 weeks

## Results

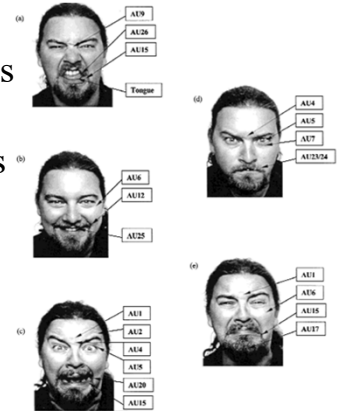

## State Changes

- Infants
  - Stanger/Mother paradigm (Fox & Davidson, 1986)
  - Sucrose Vs water (Fox & Davidson, 1988)
  - Films of facial expressions (Jones & Fox, 1992; Davidson & Fox, 1982)
- Primates
  - Benzodiazepines increases LF (Davidson et al., 1992)

## State Changes

- Adults
  - Spontaneous facial expressions (Ekman & Davidson, 1993; Ekman et al., 1990; Davidson et al., 1990)
  - Directed facial actions (Coan, Allen, & Harmon-Jones, 2001)

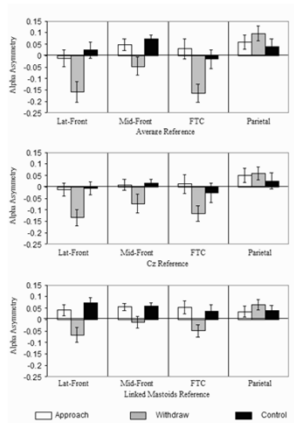

## EEG responds to directed facial actions

From Coan, Allen, and Harmon-Jones (2001)

Figure 1. Muscle movements in the full face conditions: (a) disgust, activating AU's 9 (inner wrinkler), 15 (lip corner depressor), 26 (jaw droop), and the "tongue show"; (b) joy, activating AU's 6 (cheek raiser), 12 (lip corner puller), and 23 (lips part); (c) fear, activating AU's 1 (inner brow raiser), 2 (outer brow raiser), 4 (brow lowerer), 8 (upper lid raiser), 15 (lip corner depressor), and 20 (lip stretch); (d) anger, activating AU's 4 (brow lowerer), 5 (upper lid raiser), 7 (lid tightener), 23 (lip tightener), and/or 24 (lip pressor); (e) sadness, activating AU's 1 (inner brow raiser), 6 (cheek raiser), 15 (lip corner depressor), and 17 (chin raiser).

## EEG responds to directed facial actions

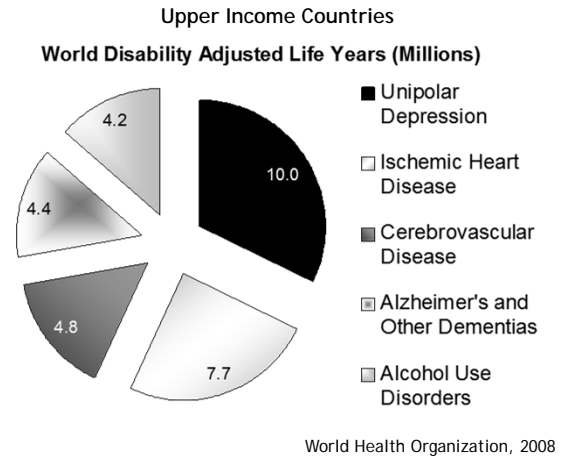

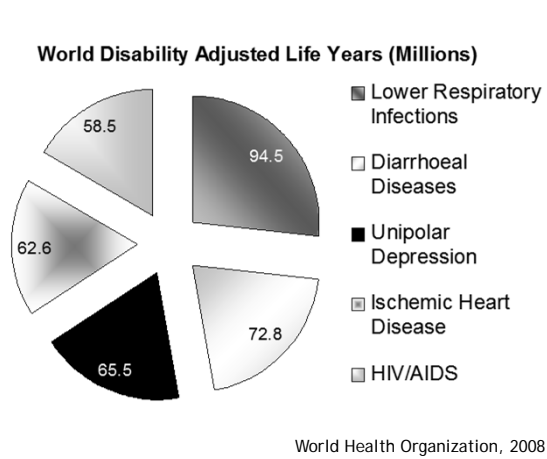

From Coan, Allen, and Harmon-Jones (2001)

## States – how short can they be?

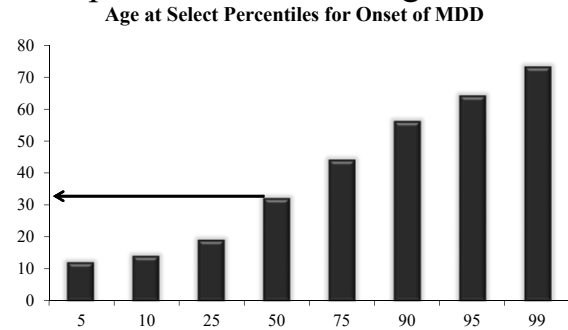

## Depression as a Heterogeneous Phenotype

- Variable Age of Onset
- Variable Symptom Presentation
- Variable Course
- Variable Response to Treatment

## Depression: Variable Age Onset

Data from Kessler et al., Arch Gen Psychiatry, 2005, 62:593-602

## Depression: Variable Age Onset

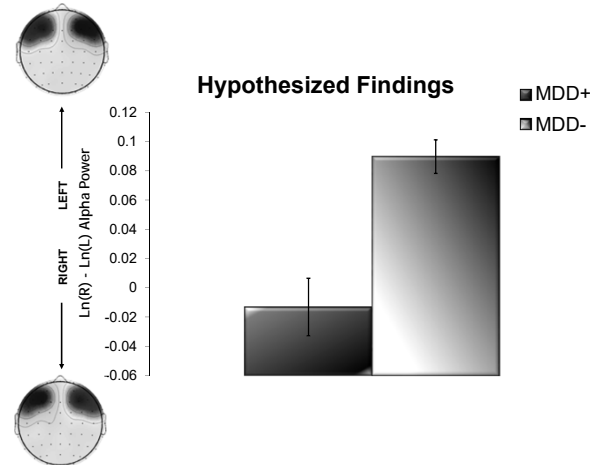

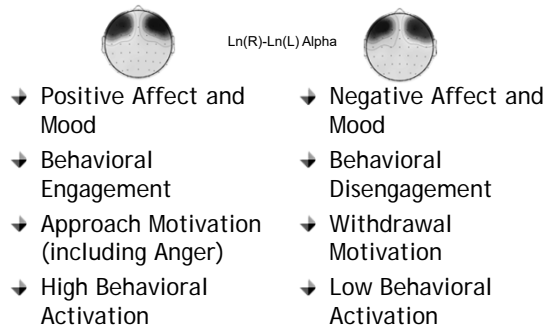

Figure 1. The relationship between the age at onset of major depression (MD) in an affected twin and the natural logarithm of the hazard ratio in the cotwin for MD (in open circles) and vascular disease (VD) (in filled-in circles). These results are obtained from a Cox proportional hazard model controlling for age, sex, and birth cohort. We fitted to these results piecewise models with a single inflection point using a grid search to find the single inflection point that maximized the model's -2 log likelihood.

Kendler, Fiske, Gardner, & Gatz, 2009, *Biological Psychiatry*

## Treating and Preventing Depression

- Identify those at risk
- Identify factors that place folks at risk
- Develop interventions to address those factors

### Frontal EEG asymmetry as risk marker for MDD

Several Desiderata...

### Frontal EEG asymmetry as risk marker for MDD

- Resting EEG asymmetry is a stable trait
  - in clinical populations (Allen, Urry, et al., 2004; Jetha, Schmidt, & Goldberg, in press; Niemic & Lithgow, 2005; Vuga, et al., 2006)
  - and nonclinical populations (Hagemann, Naumann, Thayer, & Bartussek, 2002; Jones, Field, Davalos, & Pickens, 1997; Papousek & Schuster, 1998, 2002; Tomarken, Davidson, Wheeler, & Doss, 1992; Tomarken, Davidson, Wheeler, & Kinney, 1992)

Allen, Urry, Hitt, & Coan (2004), *Psychophysiology*

### Frontal EEG asymmetry as risk marker for MDD

- Changes in clinical status are not associated with changes in resting EEG asymmetry (Allen, Urry, et al., 2004; Debener, et al., 2000; Vuga, et al., 2006).

### Frontal EEG asymmetry as risk marker for MDD

- ➔ Resting EEG asymmetry is:
  - ➔ modestly heritable (Anokhin, Heath, & Myers, 2006; J. A. Coan, Allen, Malone, & Iacono, 2009; Smit, Posthuma, Boomsma, & De Geus, 2007)
  - ➔ related to serotonergic candidate genes such as HTR1A allele variations (Bismark, et al., 2010)

### Frontal EEG asymmetry as risk marker for MDD

- ➔ Resting EEG asymmetry relates to internalizing disorders:
  - ➔ MDD and depressive symptoms (Allen, Urry, et al., 2004; Bruder, et al., 2005; Debener, et al., 2000; Diego, Field, & Hernandez-Reif, 2001; Diego, Field, & Hernandez-Reif, 2001; Fingelkurts, et al., 2006; Ian H. Gotlib, Ranganath, & Rosenfeld, 1998; J. B. Henriques & Davidson, 1990; Jeffrey B. Henriques & Davidson, 1991; Mathersul, Williams, Hopkinson, & Kemp, 2008; Miller, et al., 2002; Pössel, Lo, Fritz, & Seeman, 2008; Schaffer, Davidson, & Saron, 1983; Vuga, et al., 2006);

### Frontal EEG asymmetry as risk marker for MDD

- ➔ Resting EEG asymmetry relates to internalizing disorders:
  - ➔ Anxious arousal/somatic anxiety (Mathersul, et al., 2008; Nitschke, Heller, Palmieri, & Miller, 1999; J.L. Stewart, Levin-Silton, Sass, Heller, & Miller, 2008);
  - ➔ Panic disorder (Wiedemann, et al., 1999);
  - ➔ Comorbid anxiety/depression (Bruder, et al., 1997);
  - ➔ Social phobia (R. J. Davidson, Marshall, Tomarken, & Henriques, 2000);

### Frontal EEG asymmetry as risk marker for MDD

- ➔ Resting EEG asymmetry relates to internalizing disorders:
  - ➔ Premenstrual dysphoria (Accortt & Allen, 2006; Accortt, Stewart, Coan, Manber, & Allen, 2010);

### PMDD

Accortt & Allen, 2006

### Specificity or Spectrum: PMDD

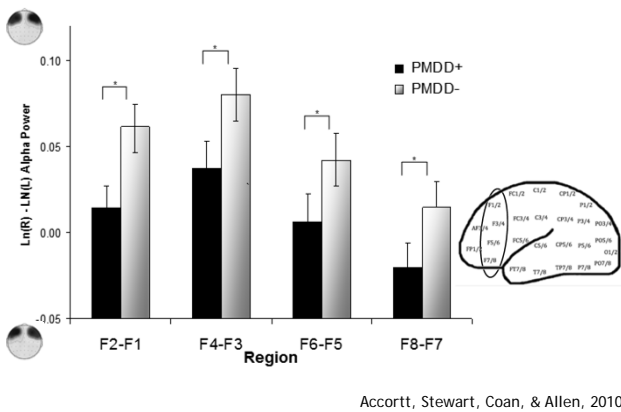

### PMDD

- Larger Sample
- Diagnostic Interviews
- Matched for MDD

Accortt, Stewart, Coan, & Allen, 2010

### PMDD

### Frontal EEG asymmetry as risk marker for MDD

- Resting EEG asymmetry relates to internalizing disorders:
  - Childhood/adolescent internalizing psychopathology (anxiety, sadness, disappointment, low empathy and sociability, higher stress cortisol, and avoidant-withdrawn behavior (Baving, Laucht, & Schmidt, 2002; Buss, et al., 2003; R.J. Davidson, 1991; Forbes, Fox, Cohn, Galles, & Kovacs, 2005; N.A. Fox, Henderson, Rubin, Calkins, & Schmidt, 2001; Henderson, Marshall, Fox, & K.H., 2004; Schmidt, Fox, Schulkin, & Gold, 1999).

### Frontal EEG asymmetry as risk marker for MDD

- Resting EEG asymmetry identifies *family members* of those with internalizing disorders
  - MDD (Dawson, Frey, Panagiotides, Osterling, & Hessl, 1997; Dawson, Frey, Panagiotides, et al., 1999; Dawson, Frey, Self, et al., 1999; Field, Diego, Hernandez-Reif, Schanberg, & Kuhn, 2002; Forbes, et al., 2007; Jones, Field, & Davalos, 2000; Jones, et al., 1997; Miller, et al., 2002; Tomarken, Dichter, Garber, & Simien, 2004).

## Meta-Analysis: Depression, Anxiety

- Studies of resting frontal alpha asymmetry
- Measures of depression or anxiety
- Both adult and infant samples
- Literature Sample:
  - 31 papers
  - 59 tests (studies, sites, reference)
  - Adult samples predominantly female

Thibodeau, Jorgensen, & Kim, 2006

Mean Effect Sizes  
 ➤ Adults  $d=0.54$   
 ➤ Infants  $d=0.61$

Moderators  
 ➤ Reference  
 ➤ Recording length  
 ➤ Co-morbidity

Publication Bias

## A "Definitive" Study

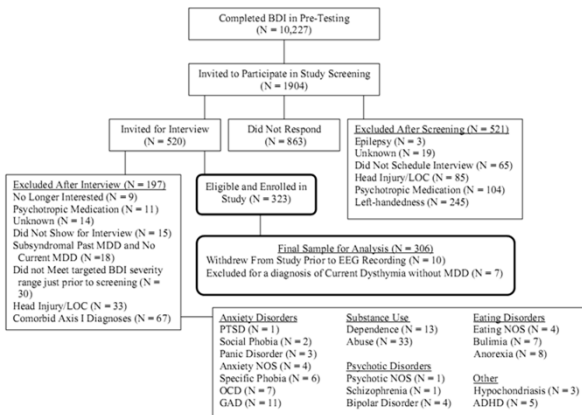

- Large (n=306), medication-free
  - Both men (n=95) and women (n=211)
  - Lifetime Depressed (n=143)
  - Never Depressed (n=163)
- Assessed for Family History
- No co-morbidity, medically healthy

Stewart, Bismark, Towers, Coan, & Allen, 2010

## A "Definitive" Study

- Large (n=306), medication-free
- Assessed for Family History
- No co-morbidity, medically healthy
- Resting EEG
  - Two sessions per day
  - Four days
- Four Reference Montages
- Mixed Linear Models

Stewart, Bismark, Towers, Coan, & Allen, 2010

Stewart, Bismark, Towers, Coan, & Allen 2010, *J Abnormal Psychology*

## Reference Effects

Resting Eyes Closed Alpha Power

### Reference Effects

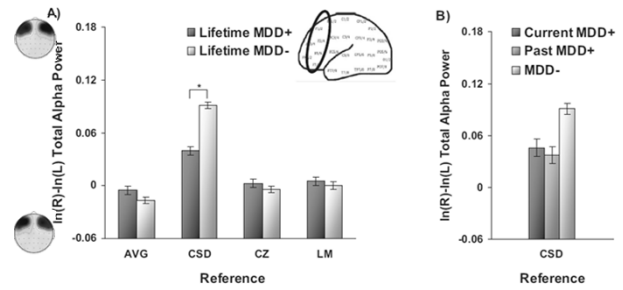

Figure 2. Panel A shows frontal alpha asymmetry scores (8–13 Hz at F2–F1, F4–F3, F6–F5, F8–F7) by lifetime MDD status for each reference montage across all four frontal regions depicted on the head insert. Error bars reflect standard error. Panel B shows results of a follow-up assessment indicating that the relationship of lifetime MDD status to CSD-referenced asymmetry is not solely accounted for by current MDD status. The y-axis is  $\ln \mu V^2$  for AVG, Cz, and LM references, and  $\ln \mu V^2/cm^2$  for CSD referenced data. MDD = major depressive disorder; AVG = average; CSD = current source density; CZ = Cz; LM = linked mastoid.

Stewart, Bismark, Towers, Coan, & Allen, 2010

### Interim Synopsis: Endophenotype Desiderata

Gottesman & Shields, 1972; Gottesman & Gould, 2003; Iacono, 1998

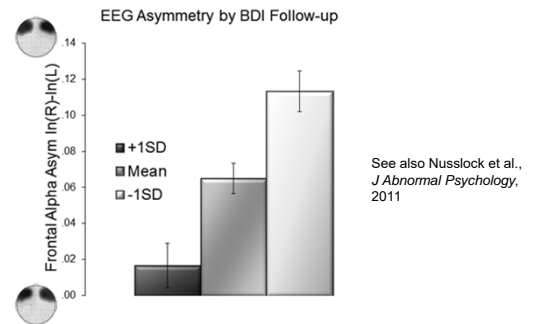

- ☑ Specificity: Associated with disorder
- ☑ Heritability
- ☑ State-independence: Primarily trait
- ☑ Familial Association: Seen in unaffected family members at rates higher than general population
- ☑ Predictive Power: predicts future disorder in unaffected individuals

STICK WITH CSD...

### Prospective Pilot Data

- ➔ Assessed never depressed (MDD-) individuals ~1 year after EEG
- ➔ Obtained 53 of 163 (representative)
- ➔ Completed BDI based on "worst month"
- ➔ BDI worst month residualized on BDI at EEG assessment
- ➔ Can EEG predict this worst month BDI score?

### Prospective Pilot Data

See also Nuslock et al., *J Abnormal Psychology*, 2011

Stewart & Allen, *In preparation*

## Thus

- Frontal EEG asymmetry has promise as a risk indicator for MDD and other internalizing disorders
- Need:
  - Large-scale prospective study
  - Links to underlying neural systems

## Asymmetry Metric Vs Individual Sites

- Is it left or is it right?
- Can assess using ANOVA with hemisphere as a factor
  - Removes overall power before testing for interaction of emotion/temperament/psychopathology with hemisphere
  - But not easily amenable for assessing relationship of EEG at given site to continuous variables

## Asymmetry Metric Vs Individual Sites

- The Problem:
  - Power at an individual site reflects:
    - Underlying neural activity
    - Scalp thickness
- An early (nonoptimal) solution
  - Residualize power at each lead based on
    - Whole head power (reasonable)
    - Homologous lead power (troublesome)

## Why does it do *that*?!

- This double residualization results in correlations with the outcome variable similar in magnitude to the difference score, but with opposite signs for the two hemispheres.
- This is actually to be expected when the predictor and criterion variable are highly correlated

Alpha Power at Homologous Sites is *Highly* Correlated

Sites	Reference	
	AR	LM
FP1 .. FP2	.997	.998
F7 .. F8	.983	.971
F3 .. F4	.990	.992
FTC1 .. FTC2	.975	.943
C3 .. C4	.977	.981
T3 .. T4	.918	.891
TCP1 .. TCP2	.944	.948
P3 .. P4	.965	.982
T5 .. T6	.907	.932

Allen, Coan, & Nazarian (2004)

Allen, Coan, & Nazarian (2004)

Consider residualized left lead power when  $L \approx R$

$$L_{resid} = L - \hat{L}$$

$$\hat{L} = a + b(R)$$

In limiting case where  $r_{LR} \rightarrow 1.0$

$$\hat{L} = 0 + 1(R) = R$$

$$L_{resid} = L - \hat{L} = L - R$$

Allen, Coan, & Nazarian (2004)

### Fancy That!

➤ Residual values for left hemisphere leads approaches  $L - R$  as the correlation between left and right leads approaches 1.0.

➤ Residual values for right hemisphere approaches the value  $R - L$  as the correlation between left and right leads approaches 1.0.

➤ Therefore, this procedure will make it appear that right hemisphere leads correlate with a criterion variable in the same direction and magnitude as the  $R - L$  difference score, and that left hemisphere leads correlate with a criterion variable in the opposite direction but same magnitude as the  $R - L$  difference score.

➤ Therefore, *don't do that!*

### What to do?

- Residualize only on whole head power, not additionally on homologous lead power
- Use hierarchical general linear models
  - can include both categorical and continuous predictors
  - can be constructed to test a variety of specific hypotheses of interest, including those related to overall power, hemisphere, and even reference scheme, all in a single model

### Deconstructing the "resting" state: Exploring the temporal dynamics of resting frontal brain asymmetry as an endophenotype for depression

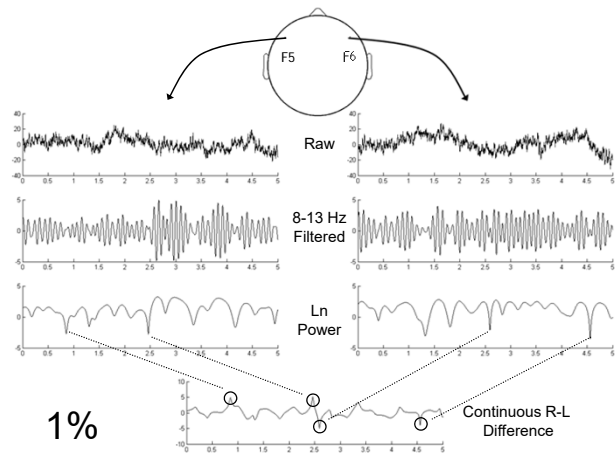

Allen & Cohen, 2010

### The Conventional Approach

- One number to summarize several minutes of resting data
- Good reliability, but...
  - Lacks temporal specificity
  - Confuses "more" with "more often"

Asym = Ln(Right) - Ln(Left) Alpha Power

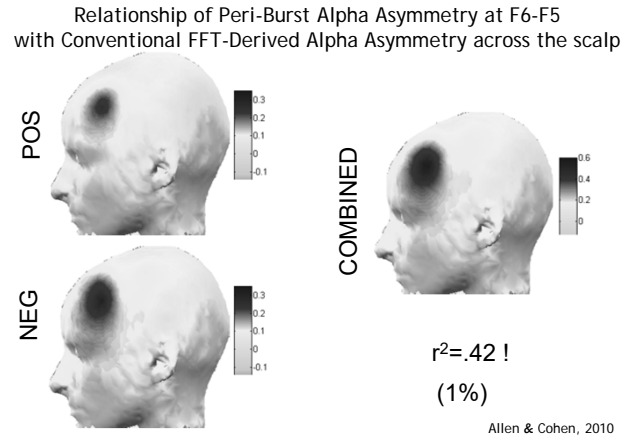

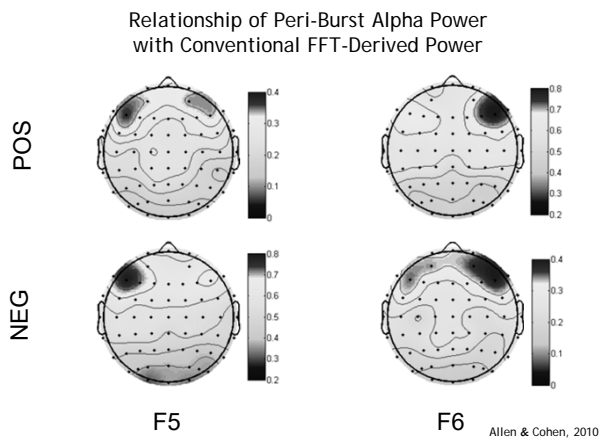

### Three Central Questions

- How do the novel peri-burst metrics of dynamic asymmetry compare to the conventional FFT-based metrics?
- Do the peri-burst metrics adequately differentiate depressed and non-depressed participants
- What EEG dynamics surround the asymmetry bursts that are captured by the novel peri-burst metrics?

### Three Central Questions

- How do the novel peri-burst metrics of dynamic asymmetry compare to the conventional FFT-based metrics?
- Do the peri-burst metrics adequately differentiate depressed and non-depressed participants
- What EEG dynamics surround the asymmetry bursts that are captured by the novel peri-burst metrics?

### Three Central Questions

- How do the novel peri-burst metrics of dynamic asymmetry compare to the conventional FFT-based metrics?
- Do the peri-burst metrics adequately differentiate depressed and non-depressed participants
- What EEG dynamics surround the asymmetry bursts that are captured by the novel peri-burst metrics?

Conventional Frontal EEG Alpha Asymmetry by MDD status

Stewart, Bismark, Towers, Coan, & Allen 2010, *J Abnormal Psychology*

Peri-burst Frontal EEG Alpha Power Asymmetry by MDD status

Allen & Cohen, 2010

Table 3. Effect sizes (Cohen's *d*) comparing depressed groups to never depressed controls.

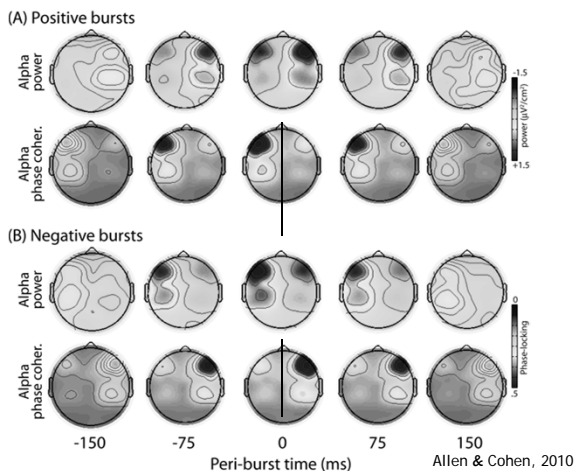

Diagnosis	Conventional	Peri-burst
Lifetime MDD	.43	.38
Past MDD only	.43	.27
Current MDD (with or without Past MDD)	.35	.45

Prospective Pilot Data

Three Central Questions

- How do the novel peri-burst metrics of dynamic asymmetry compare to the conventional FFT-based metrics?
- Do the peri-burst metrics adequately differentiate depressed and non-depressed participants
- What EEG dynamics surround the asymmetry bursts that are captured by the novel peri-burst metrics?

Allen & Cohen, 2010

So?

- Novel peri-burst metrics account for substantial variance in conventional metrics (despite being just 1%)
- Peri-burst metrics differentiate depressed and non-depressed participants, similar to conventional metrics

So?

- Bursts reflect ...
  - Transient lateralized alpha suppression that shows a highly consistent phase relationship across bursts
  - Along with concurrent contralateral transient alpha enhancement that is less tightly phase-locked across bursts
- Analogous to ERD/ERS (Pfurtscheller, 1992)?

So?

- The fact that the alpha suppression is particularly tightly phase-locked across bursts raises the possibility that the lateralized alpha suppression may drive or regulate cortical processing
- Alpha has been shown to regulate gamma power (i.e., cross-frequency coupling, Cohen et al., 2009)

### Synchronization and Desynchronization

- Supposition that alpha blocking meant that the EEG had become desynchronized
  - Yet the activity is still highly synchronized -- not at 8-13 Hz
  - May involve fewer neuronal ensembles in synchrony

### If Alpha Desynchs, what Synchs?

### Event-related

### Synchronization and Desynchronization

- Pfurtscheller (1992) -- Two types of ERS
  - Secondary (follows ERD)
  - Primary (Figure 3 & Figure 4)

Alpha power time course during reading (upper) and voluntary finger movements (lower). Primary ERS is seen over electrodes overlying cortical areas not involved in the task.

Primary ERS seen over parietal and occipital leads during right finger movement. ERD is seen over central electrodes, with earlier onset over hemisphere contralateral to movement.

### Frontal Midline Theta (more later in advanced topics)

- Increased midline frontal theta during periods of high cognitive demand
- This is specifically under conditions in which cortical resources must be allocated for select cognitive processes
  - Attention
  - Memory
  - Error Monitoring

Saueng Hoppe Klimesch Gerloff Hummel (2007)

- Complex finger movement sequences
- Varied Task Difficulty, and Memory Load (2x2 design)
- Task-related Theta Power (4-7 Hz) computed for each condition relative to 5 min. resting baseline
- Phase coherence also examined across sites
  - Phase Locking Value (0-1)
  - Then expressed as percent increase over rest

### Theta Power

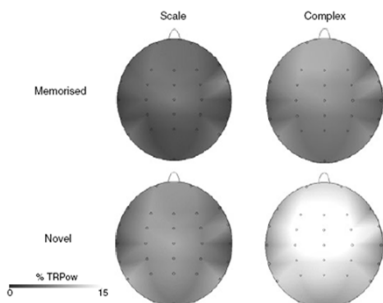

FIG. 1. Task-related theta (4-7 Hz) power increase. White indicates a strong task-related power increase compared with rest. Note that only during execution of novel and complex sequences is strong frontal-midline theta exhibited. This indicates that frontal theta activity reflects both memory load and sequence complexity.

Saueng Hoppe Klimesch Gerloff Hummel (2007)

### Theta PLV

- Higher in Novel conditions, contrary to predictions
- Speculate integration of visual with sensory-motor info
- But, does theta=theta=theta? Fronto-central vs diffuse

FIG. 3. Task-related theta phase coupling. Bold connections indicate a significant ( $P < 0.005$ ) increase of theta phase coupling compared with rest, dotted lines indicate decrease of phase coupling. There are more significant electrode pairs during execution of novel sequences compared with performance of memorized ones. This effect is independent of task complexity. During both memorized and novel, there is no significant difference of the distributed theta network between scale and complex sequences.

Saueng Hoppe Klimesch Gerloff Hummel (2007)

## 40 Hz Activity

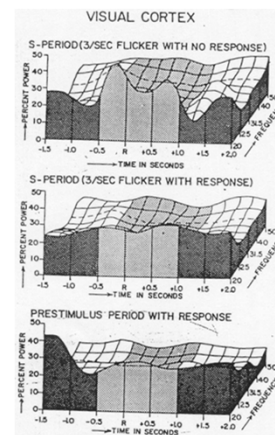

- First reports of important 40 Hz activity
- Sheer & Grandstaff (1969) review
  - pronounced rhythmic electrical bursting
- Daniel Sheer's subsequent work until his death renewed interest in "40 Hz" phenomena

Note specificity of response to  $S_D$ , over visual cortex to discriminative stimulus, in 40-Hz range; Some hint of it later in the motor cortex. Note also decreased activity in slower bands during the same time periods.

## Sheer work with Cats

- Learning paradigm
- Cat must learn
  - press to  $S_D$  (7cps light flicker)
  - not  $S-$  (3 cps light flicker)
  - the hypothesis is that the synchronized 40 Hz activity represents the focused activation of specific cortical areas necessary for performance of a task

Note very different pattern to  $S-$ . No 40-Hz change in visual cortex, and marked increase in lower frequencies at same time period.

## Human Studies

- Hypothesis is that 40 Hz activity correlates with the behavioral state of focused arousal (Sheer, 1976) or cortical activation
  - a "circumscribed state of cortical excitability" (Sheer, 1975)
  - Bird et al (1978)
    - biofeedback paradigm
    - increased 40 Hz activity is associated with high arousal and mental concentration
  - Ford et al., (1980)
    - subjects once trained to voluntarily suppress 40 Hz EEG are unable to maintain that suppression while simultaneously solving problems
    - concluded that problem solving and absence of 40 Hz are incompatible

## Lateralized Task Effects

- Loring & Sheer (1984)
  - right-handed students
  - analogies task
  - spatial Task
- Results transformed into laterality ratios:
  - $(L-R)/(L+R)$  40 Hz
  - higher # => greater LH activity (P3-O1-T5 triangle vs P4-O2-T6 triangle);
- Results
  - greatest variability during baseline
  - smallest variability and greatest LH activation during verbal
  - no laterality effects in the 40Hz EMG bands

### Laterality of 40 Hz

### Controlling for EMG contributions

- Spydell & Sheer (1982)
  - used similar tasks and found similar results
  - using conservative controls for muscle artifact

Hy, 1982 Alpha, Beta II, 40 Hz EEG, and 40 Hz EMG Activity 423

TABLE 1  
Median changes in rate scores

Problems	Alpha		Beta II		40 Hz Total		40 Hz EMG		40 Hz EMG	
	Left	Right	Left	Right	Left	Right	Left	Right	Left	Right
Verbal	-36.7*	-52.4*	-20.1*	-20.2*	1.0*	0.1	1.2*	0.1	8.4*	10.6*
Reaction	-36.1*	-37.6*	-15.3*	-15.3*	0.7	1.0*	0.4	0.9*	13.9*	8.5*

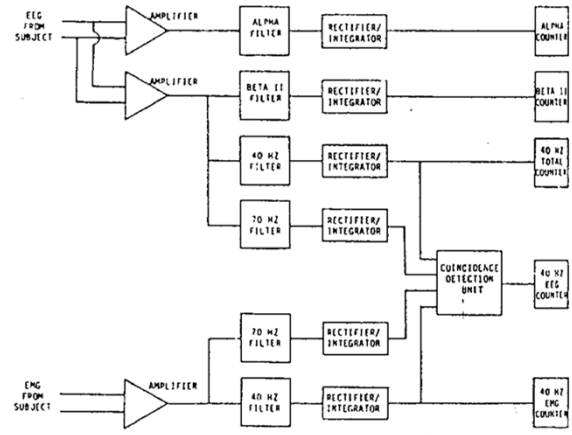

\*p < .05.

Spydell and Sheer Vol.

TABLE 3  
Spearman rank-order correlations between various 40 Hz activity measures

40 Hz Measure	Verbal				Nonverbal			
	Left	Total	Right	Total	Left	Total	Right	Total
40 Hz EEG	.74*	.68*	.68*	.94*	.27	.35	.16	.25
40 Hz EMG	.27	.28	.29	.25	.27	.35	.16	.25

\*p < .05.

### Individual Differences

- Spydell & Sheer (1983), Alzheimers
  - controls showed task related changes in EEG with appropriate lateralization
  - Alz did not
- Schnyer & Allen (1995)
  - Most highly hypnotizable subjects showed enhanced 40 hz activity

So this is exciting, why hasn't this work exploded?

- The EMG concern
  - The concern is likely over-rated (recall Table 3)
- Sheer died
- But not all is lost, as there is renewed interest...

Mukamel et al *Science* 2005  
 recorded single unit activity and local field potentials in auditory cortex of two neurosurgical patients and compared them with the fMRI signals of 11 healthy subjects during presentation of an identical movie segment. The predicted fMRI signals derived from single units and the measured fMRI signals from auditory cortex showed a highly significant correlation.

## Singer (1993)

- Revitalized interest in the field

## The Binding Problem

- Potentially infinite number of things and ideas that we may attempt to represent within the CNS
  - Cells code for limited sets of features,
  - These must somehow be integrated
  - -- the so-called binding problem
- If there exists a cell for a unique contribution of attributes, then convergent information from many cells could converge on such a cell
  - But there are a finite # of cells and interconnections
- And even the billions and billions of cells we have cannot conceivably handle the diversity of representations

## Implications

- Also allows for the possibility that there exists no direct neuronal connection between neurons within an assembly
  - merely the fact that they are simultaneously activated that makes the unified experience of the object possible
- This is most likely when there is an oscillatory regularity
  - If networks are tuned to a single frequency, they are easy to synchronize, but difficult to desynchronize – PROBLEM!
  - Therefore it may be adaptive to have a broader-band oscillator (centered on ~40 hz)
  - Cannot be too slow (e.g., alpha) since this would be inadequate to successfully bind percepts together efficiently
  - Cannot be much faster than gamma since the human nervous system cannot allow synchronization at frequencies much beyond gamma

## The Functional Perspective -- as yet merely a theory

- There is no site of integration
  - Integration is achieved through simultaneous activation of an assembly of neurons distributed across a wide variety of cortical areas
  - Neurons in such assemblies must be able to adaptively identify with other neurons within the assembly while remaining distinct from other neurons in other assemblies
  - This association with other neurons is through a temporal code of firing (Synchronicity)
    - This even allows for the possibility that a single neuron could be part of two active assemblies (via a multitasking procedure)

## Functional Role of Gamma Synchronization

- Feedforward coincidence detection
  - To summate effectively, signals must arrive at post-synaptic neuron from multiple sources within msec of each other (else decay)
  - Gamma-band synchronization can lead to temporal focusing of inputs from multiple and distributed pre-synaptic neurons
- Rhythmic Input Gain Modulation
  - Excitatory input is most effective when it arrives out of phase with inhibitory input and vice versa
  - Allows for precision and efficiency of signal transmission (or inhibition)

Fries, 2009

## Implications

- This view is a dynamic view
  - depends on experience
  - can change with experience
- Synchronously activated units more likely to become enhanced and part of an assembly that will subsequently become synchronously activated
- Singer concludes:
  - Points out the problem of looking for synchronous activation on the micro level, suggesting that a return to the EEG literature looking for task-dependent synchronization in the gamma (aka 40 Hz) band!
- Forty-Hz may indeed make a comeback!
  - “Forty” =  $40 \pm$  some range
  - Gamma! (Stay tuned during advanced topics)
